Our findings indicate that relocation often disrupts established travel patterns. However, this disruption also presents an opportunity to promote and support active and public transportation options.
DROUGHT

Rising temperatures are increasing water demand. Our research revealed that drought and water restrictions not only strengthened water conservation efforts but also raised concern about climate change.
COVID-19

Our research on the COVID-19 pandemic revealed significant shifts in everyday routines, particularly concerning food, work, and travel. These changes led to a notable reduction in carbon footprints.
